often gathered together, and at times all of the women of a house would work together in *piquí* collecting. Parties of boys and men sometimes picked up the fruit, and a man often went gathering with his wife to protect her from possible enemies, especially if there had been recent threats or omens. He took his bow and arrows, and frequently did not help in carrying the fruit back to the village. The *piquí* was brought to the village in basket containers, and then made into a variety of dishes.

Guava (*waruwaru*) grows wild in the forest, ripening a short time before *piquí* does, but extending into the season of the latter. Quain believed it to be a valuable vitamin C supplement to the diet, but it was a far less important food than *piquí*. Men participated little in guava collecting, although they accompanied their wives for sociability and protection. Quain described these connubial gathering expeditions as being largely pleasant jaunts through the wood. Children often went out for the fruit, which they brought back to the village [illegible]ung on straws.

The water lily from which salt was made was another important item gathered during the period of Quain's residence among the Trumaí. The water lilies were collected in the Trumaí lagoon, and the complete salt-making process was carried on there. Each Trumaí built a rack over the waters of the lagoon. The lilies were pulled up, spread out on the rack to dry, and later burned. The ashes were sifted to obtain the salt. Quain did not mention any women's salt racks, but the women prepared their own supply of salt, too. Quain saw salt-making only in the early part of September, although it is possible that it occurred prior to this time as well. However, salt was not made after the middle of September, due to the rains and the exigencies of planting.

Ants were eaten by the Trumaí, and, according to an informant, by all groups in the area. A little boy demonstrated the correct way to consume them when he joyously brought in a fat one, plucked off its abdomen and swallowed it. Quain was told that later in the season the women and children would go out and collect them in large quantities. Other insects were in heavy demand for feeding the harpy eagle and other pet birds. Crickets were considered especially good for this purpose, and the boys made great sport of shooting these insects with their miniature bows and arrows.

A few other wild foods were eaten, but these were relatively insignificant. Among them was the fruit of the *awa'o* palm. Another fruit called *lamux*, resembling the crabapple in taste and superficial appearance, had a gelatinous interior. An unnamed plant is described by Quain as resembling grass, but having a quality like algae. It was eaten only in times of a manioc shortage. *Kamu'u* is a parasitic plant that looks and tastes like the date. The *atoh* is a berry that tastes like the chokecherry.

Fift'a and *tsucusi*, the fish poisons, were gathered in the locale. The gathering and preparation of *tsucusi* boughs was a cooperative venture.

Black zig-zags on a grayish background were painted on the body of one of the singers. Many designs were undoubtedly conventionalized, but seemingly not according to rigid standards.

All of these designs were observed on men. The women painted themselves much less often, and their patterns were far simpler. Blackened foreheads and black streacks on the thighs were most common. The latter looked as if the women had merely wiped their hands on their thighs after having painted their husbands.

Children also had their bodies painted. Some of the boys blackened their faces or had black dots put on their chests. One little girl had black angles painted on her cheek by her mother. Children's and women's body designs were simple and required little paint. The men reserved most of the paint for themselves.

A husband's painting was often done by his wife, but men frequently adorned themselves or another man, particularly a younger close relative. There may also have been specialized knowledge of certain designs. Only one man was said to be able to make the zig-zag snake pattern, and he painted it on the bodies of others.

Work Patterns

Accompanying the low degree of specialization and cooperation in production was a lack of rhythm in the work habits of the Trumaí. The day started at about three or four o'clock in the morning. At this time many persons got out of their hammocks to fan their fires and huddle around them, for these were the chilliest hours. The men might get together at this time and talk while the women prepared food. Not much work was done then. At most, a man might add some thatch to his house. By sunrise everyone was awake, and the women went in a body to a nearby arm of the lagoon to bathe and draw containers of water. The men usually went to bathe a little later in pairs or alone. After bathing, everyone ate, and the work day really began.

Those who intended to garden went out early and labored until ten or eleven o'clock, that is, while it was cool and insects were less troublesome. As a rule, they ate again upon returning and then stayed in the village the rest of the day, working at various crafts as the spirit moved them. Actually a good deal of time was spent loafing and sleeping.

Those who planned to fish started out in the morning, but usually after the gardeners had departed. Unless a two or three day trip was planned, they commonly returned by four o'clock, and always before dark. Occasionally a group of men and women went to the lagoon to spend a day or two making salt.

One of the striking features of Trumaí economic activity was the number of different tasks done by various people on the same day.
